

10mL MULTI-DOSE VIAL **SUSTANON DEPOT**

Concentration	250mg/ml
Route of A.	Intramuscular
Schedule	CIII - Rx Only
Form	Injectable

Sustanon Depot is an oil-based injectable preparation containing four esterified forms of testosterone with different release characteristics. Each millilitre contains testosterone propionate, testosterone phenylpropionate, testosterone isocaproate, and testosterone decanoate. Together, these esters provide a total of 250 mg of testosterone esters, equivalent to approximately 176 mg of testosterone.

Following intramuscular administration, the testosterone esters are gradually released from the injection site and converted into active testosterone through enzymatic cleavage. Testosterone binds to androgen receptors and influences androgen-dependent physiological processes, including reproductive function, sexual development, protein metabolism, bone maintenance, and red blood cell production.

Testosterone preparations may be used as replacement therapy in male patients with testosterone deficiency confirmed by compatible clinical findings and appropriate laboratory testing. The indication and treatment conditions should be determined through individual medical assessment and in accordance with the approved prescribing information of the intended market.
