

10mL MULTI-DOSE VIAL
**TESTESTERONE
CYPIONATE**

Concentration	200mg/ml
Route of A.	Intramuscular
Schedule	CIII - Rx Only
Form	Injectable

Norwick

Testosterone Cypionate is an esterified form of testosterone formulated as an oil-based solution for intramuscular administration. The cypionate ester modifies the absorption profile of testosterone and supports gradual release from the injection site. Following enzymatic cleavage of the ester bond, active testosterone becomes available to interact with androgen receptors in androgen-responsive tissues.

Testosterone is a naturally occurring androgenic hormone involved in the development and maintenance of male reproductive tissues and secondary sexual characteristics. It also influences protein metabolism, bone tissue, body composition, sexual function, and red blood cell production.

Testosterone Cypionate may be used as replacement therapy in male patients with testosterone deficiency caused by an associated medical condition. The diagnosis should be supported by compatible clinical findings and appropriately confirmed serum testosterone measurements. Its safety and effectiveness for testosterone reduction associated solely with ageing have not been established.
