

# FULL – DOSE TURINABOL

Concentration \_\_\_\_ 10mg/Tablet  
Route of A. \_\_\_\_ Oral  
Schedule \_\_\_\_ CIII - Rx Only  
Form \_\_\_\_ Tablet

Turinabol is an orally administered anabolic-androgenic steroid containing dehydrochloromethyltestosterone, also known as chlorodehydromethyltestosterone. It is a synthetic testosterone derivative characterized by structural modifications at the 4-chloro and 17-alpha positions, which allow the compound to remain pharmacologically active following gastrointestinal absorption.

Dehydrochloromethyltestosterone interacts with androgen receptors and influences androgen-responsive biological processes, including protein metabolism and nitrogen retention. The nature and intensity of its pharmacological effects may vary according to dose, duration of exposure, individual sensitivity, general health status, and concomitant substances.

As a 17-alpha-alkylated oral anabolic agent, dehydrochloromethyltestosterone may produce clinically significant effects on hepatic function, lipid metabolism, endocrine balance, and cardiovascular parameters. Oral 17-alpha-alkylated anabolic steroids are particularly associated with an increased risk of hepatic adverse effects and therefore require appropriate clinical and laboratory evaluation.
